Evaluation of Metal Containers for Shipping Hazardous Materials

(U.S.) Naval Air Development Center, Warminster, PA

Prepared for

Department of Transportation, Washington, DC Office of Hazardous Materials

Sep 72

8000688

The contents of this report reflect the views of the Naval Air Development Center which is responsible for the facts and the accuracy of the data presented herein. The contents do not necessarily reflect the official views or policy of the Department of Transportation. This report does not constitute a standard, specification or regulation.

A B S T R A C T

An investigation was conducted to evaluate various types of new metal drums and pails being used for the packaging and shipping of hazardous materials, to determine if these containers will spill their contents when subjected to high internal pressure and to specified rough handling tests. Various quantities of 17H and 17C open head drums as well as samples of 37A and 37C drums and pails spilled liquid contents after rough handling. In addition, some 37A, 37B drums and 37A and 37C pails spilled their dry (powder) contents after rough handling.

I N T R O D C T I O N

The Office of Hazardous Materials, Department of Transportation (DOT) initiated a project for the purpose of testing and evaluating the various types of new drums and pails being used for packaging hazardous materials. It is expected the data gathered will form a basis for potential, future regulatory amendment as well as to confirm generally the quality of drums and pails being furnished by and stated by the industry to conform with the requirements of Title 49 CFR Parts 170-189.

For this project, the Naval Air Development Center was supplied drums and pails submitted by members of the Steel Shipping Container Institute. In keeping with the DOT invitation to industry to witness the testing of the containers, various representatives witnessed these tests as listed in the Appendix.

S A M P L E S A N D P R E P A R A T I O N

The Naval Air Development Center received 289 containers, designed to conform to the DOT specifications, for testing. Of these, 165 were 55 gallon drums and 124 were 5 gallon pails which varied in the style of closure and gauge of the metal. Also included were the special mono-stress 55 gallon metal drums and some 55 gallon plastic drums. The number of containers received under each specification, the type of closures and gauge of metal used in each container are listed in Table 1. Containers designated for pressure tests were fitted with bulkhead nipples for pressurizing the containers. The nipple was placed in the center of

used for all open head 55 gallon drums as illustrated in Figure 1. The nipple was placed in the center of the bottom of all 5 gallon pails. On the closed head, 55 gallon drums, the 3/4 inch bung was adapted to pressurize the drums. No special preparations were required on those containers designated to be subjected to the drop tests.

PROCEDURE

Visual Examination. Each container was examined for dents, creases, type of seam and chimes, and repair if any. Gaskets were examined for material, conditions, type, mold marks and fit. Number of lugs and spacing on lug-head covers, number and distance between hoops were noted. The height of the drum, distance between the 2 inch and the 3/4 inch bung openings, diameter of containers and convexity in heads of drums were also noted. The markings were examined for size, whether they were embossed, and if they were complete with name, gauge, rated capacity, year of manufacture and DOT specification (see Table 2). Ten per cent of the containers under each specification were measured for thickness (see Table 3). The gauge thickness of the containers was measured with an automatic ultrasonic Digital Thickness Gage, Model G2-B, illustrated in Figure 2. The measurements were made by placing a transducer, which had been calibrated, firmly in contact with the container, Figure 3. The ultrasonic signal emitted by the transducer passes through the material and is picked up and amplified by the unit. The thickness in thousandth of an inch was noted on the readout digital scale.

The gauges of the containers were found to be slightly thicker than

marked on the container. The general overall appearance and condition of the containers were good. A few minor dents and small areas where paint had been scuffed off in shipment were observed. Twelve 5 gallon closed head pails were received without flex spouts. Only three containers, one 55 gallon drum and two 5 gallon pails, all open head, were damaged in shipment to the extent they could not be tested. The open ends of these containers were bent out of round at the upper chime; therefore, the covers would not fit properly.

Hydrostatic Pressure Test. The containers were filled to 100 percent capacity with water, wiped dry, closed and sealed. The torque applied to the closed head containers depended on the type of gasket and type of fitting used. The torque in pound-feet for the 2 inch opening with the Rieke Corporation fitting was 40 with asbestos, 30 with Hycar (Buna), 40 with polyethylene, 30 with ethylene-propylene terpolymer, and 40 with Dapon. For the American Flange and Manufacturing Company 2 inch fitting, the torque in pound-feet was 15 with Buna rubber, 25 with polyethylene, and 40 with fiber. The 3/4 inch openings were not torqued because they were used to attach an air line for pressurizing the containers. The open head 55 gallon drums were torqued to 50 pound-feet. The 5 gallon pails fitted with a Rieke Flex Spout were closed and sealed using a Rieke Flex Spout Crimper. Five gallon open head pails were closed and sealed with a 16 lug pail crimper.

The equipment used to conduct this test consisted of (1) two high pressure and two low pressure gauges, (2) one pressure regulator, (3) one bleed-off and one cut-off valve, (4) four roll over drum stands, and (5)

Imperial Hand Model, 120 psig test supply. All gauges were calibrated on 3 May 1972 using an Ashcroft Dead Weight Gauge Calibrator, Model 1390, Serial No. 11617/1742B.

The containers were placed on the roll over drum stand on their side with the locking ring joint, the 2 inch closure and the side seams down. Each container was pressurized to the test pressures listed below.

<u>Drum</u>	<u>Pressure (psig)</u>
DOT-5 (closed head)	40
DOT-5A	80
DOT-5B (closed head)	40
DOT-6J (closed head)	15 (12 gauge)
DOT-17C (closed head)	40
DOT-17C (open head)	20
DOT-17E	15
DOT-17H	15
DOT-37A (5 gallon)	7
DOT-37B (5 gallon)	7
DOT-37C	5
DOT-37D	15
Monostress II	40

The test pressures were maintained for 5 minutes or until spillage was noted, indicating a leak. The results reported in Table 4 reveal that eight drums and seven pails failed the test. The drum failures were noted as leaks at the locking ring joint for Exhibits 14, 38, 53, 57, 58, 92, 112, 113, and a leak at the 2 inch bung adaptor for Exhibit 128.

The pail failures were noted as a leak at the flex spout for Exhibit 29, a leak at the upper chime for Exhibit 36, and a leak at the cover for Exhibits 7, 48, and 73. The failures are illustrated in Figure 4 through Figure 11.

Pneumatic Leak Test. Containers subjected to this test were prepared, torqued, and tested using the same equipment as in the hydrostatic pressure test except empty containers were tested. The empty containers were pressurized to the internal air pressures listed below.

The pressures were maintained for 5 minutes or unless a leak was noted by a drop in the pressure gauge. After reaching the required pressure, a bubble supporting solution was applied to the seams, upper and lower chimes, and fittings. The containers were examined for evidence of leakage. The results reported in Table 4 reveal that no drums failed the test; however, five pails failed the test. The failures are noted as leaks at the lids for Exhibits 9, 10, 49, and 76. Exhibit 58 leaked at the intersection of the side seam and top chime. The type of failures are illustrated in Figures 12 and 13.

Diagonal Drop Test. Containers were filled with water to 98 percent capacity. The drums were filled to within 1-3/4 inches of the top and the pails within 1-1/2 inches of the top. Each container was closed and torqued as stated in the hydrostatic pressure test. The equipment consisted of a (1) crane for raising containers to drop height, (2) "Any Angle" drum lifter for positioning the drum for drop, (3) adjustable drum sling, and (4) a helicopter personnel automatic/manual quick release mechanism. A reinforced concrete pad 10 x 10 x 2 feet was used as the impact surface.

The containers were lifted using the drum lifter and positioned so that the head of the container faced downward and formed a diagonal with the impact surface as illustrated in Figure 14.

For the closed head containers, the 2 inch bung was placed in the center of the impact area. For the open head 55 gallon drum, the locking ring joint was positioned so it would impact the test pad. The containers were raised to the heights listed below and dropped diagonally on to the concrete pad.

<u>Specification</u>	<u>Height of Drop (feet)</u>

Monostress II	6

After drop, the containers remained in the first position for 2 minutes during which time the container and concrete pad were examined for spillage. The containers were turned two revolutions, brought to rest at a different position for one minute and re-examined for spillage. They were removed from the impact area and placed head down and examined again for spillage. Spillage in the first two minutes was listed as a failure.

The results reported in Table 4 indicated that 11 drums and 11 pails failed. The drum failures were noted as leaks in the impact area for Exhibits 20, 16, 50, 54, 68, 141, and leaks at the locking ring joint for Exhibits 132 and 140. The latter drums (132 and 140) were not tested, the leaks having occurred when they were lifted for testing. The failures are illustrated in Figures 15 through 19. Pail failures were noted as a leak at the flex spout of Exhibit 37, severe leaks in the impact area for Exhibits 5, 6, 8, and 57 when dropped from 32 inches, and a slight leak for Exhibit 67 when dropped from 28 inches. Exhibits 41 and 44 leaked after a 4-foot drop, Exhibit 43 leaked after a 42-inch drop, and Exhibits 46 and 47 leaked after a 36-inch drop. Typical failures are illustrated in Figures 20 through 26.

Horizontal Drop Test. The containers were prepared and tested in the same manner using the same height and test equipment as for the diagonal drop test, with the exception that the containers were raised as illustrated in Figure 27 and dropped so that the side seam impacted the base pad. After drop, the container and pad were examined for spillage. The results reported in Table 4 reveal that seven drums and six pails failed the test. Failures for the drums were noted as leaks at the locking ring joint of Exhibits 12, 15, and 73, and Exhibit 39 leaked at the end of the crush pattern. Exhibit 110 leaked at bottom chime, and Exhibits 142 and 143 leaked at the locking ring joint when lifted by the crane to be dropped. The latter two drums (142 and 143) were not dropped. Failures of the pails were noted as leaks at the covers of Exhibits 11, 45, 50, 60, 61, and 66. Typical failures are illustrated in Figures 28 through 35.

Powder (Dry Test. Containers were filled to within 2 inches of the normal loading depth and to the gross weight marked on the container with dry sand. Where necessary, materials such as lead shot and empty cans and foamed cushioning materials were used to attain the required weight and still maintain the loading depth. The sand was topped with 2 inches of sodium bicarbonate which is the test material. Each container was closed for test. Containers fitted with the standard closing ring and the lap type of closure ring were torqued to 200 inch-pounds. Beyond this torque the closure ring bent. Containers with 9 inch opening were closed with a special crimping tool. The pails were closed using a 16 lug crimper and a Rieke spout crimper. The containers were tested in the same manner using the same equipment as for the diagonal and horizontal drop tests previously discussed, with the exception that the drop was 4 feet for all containers. After each drop the container was examined for spillage.

The results reported in Table 4 indicate that seven drums and five pails failed. Drum failures were noted as a split chime at the bottom of the container for Exhibit 71, a leak at the end of the crush pattern for Exhibit 158, and a leak at the ring closure for Exhibits 69, 160, and 163. Metal tore 3 inches at the bottom chime for Exhibit 157 and a leak at the ring closure for Exhibit 69. Failures for the 5 gallon pails were noted as leaks at the end of the crush patterns for Exhibits 90, 91, 103, 105, and 116. The failures are illustrated in Figures 36 through 46.

DISCUSSION OF RESULTS

The measured gauge of the containers submitted indicated that the metal used was thicker than that marked on the container. The thickness varied from one to two gauges thicker than that indicated.

The initial failure of the open head 55 gallon drums under the 17H and 17C categories led to changes in the torque requirement for these containers. The torque specified was 50 pound-feet for open head drums; however, industry questioned this torque since it did not use a specific torque when it tested containers as specified in Title 49. The locking ring was tightened until the distance between the bottom of the locking ring and the side of the container was approximately 1/16 inches. The method could hardly be used as a standard. After some discussion between DOT and industry representatives, 800 pound-inches (66.7 pound-feet) was set as the torque for open head drums. Failures still occurred after retorquing to 800 pound-inches. Because of the controversy concerning the torque requirement, industry requested that another group of fourteen 17H 55 gallon drums be dropped. This time the containers would be closed until the distance between the ends of the locking ring was 1/4 inch. They would then be subjected to the diagonal and horizontal tests only. The locking ring was closed to 1/4 inch or less on 11 drums, 17/32 inch on one drum, and two drums were torqued to 800 pound-inches. Six of the 14 drums received for test failed. Four drums which were closed until the distance between the ends of the locking ring was 1/4 inch and one drum torqued to 800 pound-inches leaked at the locking ring joint when lifted to be dropped. The other drum leaked in the crush pattern after being dropped.

Failures noted in the case of the 37A and 37C 5-gallon pails were due to the severity of the tests. Containers under these two categories were to be tested using powder as the contents. The 37A containers were to be dropped from 48 inches and the 37C containers from 32 inches. An attempt was made to determine if these containers could be used to ship liquids. The water-filled pails failed when dropped from the specified height. The drop height was lowered until the containers would pass. The 37A containers failed at the 36 inches height. However, there were not enough containers to determine the height at which they would pass. For the 37C containers, the drop height at which they passed was 28 inches for the diagonal drop and 24 inches for the horizontal drop. A brief resume of the complete air and liquid tests is noted in Table 6.

For the powder test, the open head drums under the 37A category failed because of the closure ring. An attempt to increase the torque resulted in bending of the ring. Therefore, no further attempt was made to tighten the ring. The failure of the 37B drums was attributed to the high pressure used to form the chime, thereby thinning the material in this area. Failure of the 5-gallon pails in the 37A and 37C categories may be due to the excessive weight specified for the containers. No failures were noted for the horizontal drop test. There were not sufficient containers available to determine the height at which the containers would pass the diagonal drop test. A brief resume of the powder test is noted in Table 5.

CONCLUSIONS

It is concluded that the massive failure of the open head drums under categories 17H and 17C drums is attributed to the inadequacy of the locking ring and not the severity of the test. The failures noted for the 37A and 37C 5-gallon pails are believed due to the severity of the test requirements. These pails failed when dropped at the specified height of 48 inches but passed when dropped at heights of 28 and 24 inches for the diagonal and horizontal drop tests, respectively. Such heights are too low to consider their use for shipment of hazardous liquids since the average trailer-bed height is 48 inches. These containers may spill their contents if accidentally knocked from a loading platform or a tail gate.

It is further concluded that the failure of the open head drums under category 37A and evaluated in the powder test is also attributed to the inadequacy of the locking ring. The failure of the pails is due to weight specified for the containers.

RECOMMENDATIONS

It is recommended that the manufacturers be requested to redesign the locking ring to enable the 17H, the open head 17C, and 37A drums to meet the pressure and drop test requirements. It is further recommended that the 37A and 37C pails not be used to ship hazardous liquid or powder materials.

TABLE 4. TABLE OF RESULTS

Exhibit	Company	DOT Specification	CFR Section Title 49	Gauge	Size	Type Closure	Test	Test Requirement	Result	Remarks	Figure
1	A	17C	178.115	16	55	Closed	Hydro-static	40 PSIG	Pass	Crowning of both heads - radial stress lines, top and bottom chimes uncurled 4 inches from 2-inch bung.	
2	A	17C	178.115	16	55	Closed	Diagonal	4 FT	Pass	No leaks - distortion at 2-inch bung area.	
3	A	17C	178.115	16	55	Closed	Pneumatic	15 PSIG	Pass	No distortion.	
4	A	17E	178.116	18	55	Closed	Hydro-static	15 PSIG	Pass	Slight radial stress lines top and bottom.	
5	A	17E	178.116	18	55	Closed	Diagonal	4 FT	Pass		
6	A	17E	178.116	18	55	Closed	Pneumatic	7 PSIG	Pass		
7	A	17E	178.116	20/18	55	Closed	Hydro-static	15 PSIG	Pass	Excessive radial stress on top and bottom.	
8	A	17E	178.116	20/18	55	Closed	Diagonal	4 FT	Pass		
9	A	17E	178.116	20/18	55	Closed	Pneumatic	7 PSIG	Pass		
10	C	17H	178.118	18/16	55	Opened	Diagonal	4 FT	Fail	Severe leak at impact area.	

TABLE 4. TABLE OF CONTENTS (Con't)

Exhibit	Company	DOT Specification	CPR Section Title 49	Gauge	Size	Type Closure	Test	Test Requirement	Result	Remarks	Figure
11	C	17H	178.118	18/16	55	Open	Hydro-static	15 PSIG	Pass	Retorque to 800 in.lb. Slight crowning and excessive radial lines top.	
12	C	17H	178.118	18/16	55	Open	Horizontal	4 FT.	Fail	Leak at locking ring joint.	28
13	C	17H	178.118	18/16	55	Open	Pneumatic	7 PSIG	Pass	Very slight crowning top and bottom.	
14	C	17C	178.115	16	55	Open	Hydro-static	20 PSIG	Fail	Retorque to 800 in.lb. Leak at 18 lb. at locking ring joint.	4
15	C	17C	178.115	16	55	Open	Horizontal	4 FT	Fail	Retorqued to 800 in.lb. Locking ring near bottom.	29
16	C	17C	178.115	16	55	Open	Diagonal	4 FT.	Fail	Retorqued to 800 in.lbs. Leak at end of crush pattern.	16
17	C	17C	178.115	16	55	Open	Pneumatic	15 PSIG	Pass	Retorqued to 800 in.lb. Slight crowning and radial lines top and bottom.	
18	C	17C	178.115	16	55	Closed	Pneumatic	15 PSIG	Pass	Slight radial stress lines top and bottom heads.	
19	C	17C	178.115	16	55	Closed	Diagonal	4 FT	Pass	Leak at distorted chime after two minutes.	
20	C	17C	178.115	16	55	Closed	Hydro-static	40 PSIG	Pass	Excess crowning and radial lines top and bottom.	

TABLE 4. TABLE OF RESULTS (Con't)

Exhibit	Company	DOT Specification	CFR Section Title 49	Gauge	Size	Type Closure	Test	Test Requirement	Result	Remarks	Figure
21	C	17C	178.115	16	55	Closed	Horizontal	4 FT	Pass		
22	C	17E	178.116	20/18	55	Closed	Diagonal	4 FT	Pass	No leaks. Distortion at 2-inch bung.	
23	C	17E	178.116	20/18	55	Closed	Horizontal	4 FT	Pass	Drum humped on top at rest position.	
24	C	17E	178.116	20/18	55	Closed	Hydro-static	15 PSIG	Pass	Excessive crowning top and bottom with radial lines.	
25	C	17E	178.116	20/18	55	Closed	Pneumatic	7 PSIG	Pass	Very slight crowning. Slight radial stress lines top and bottom.	
26	C	37D	178.137	21/20	55	Closed	Diagonal	4 FT	Pass	Dropped from crane about 8 feet on corner of cement. No leak. Retest at 6 feet on diagonal.	
27	C	37D	178.137	21/20	55	Closed	Hydro-static	15 PSIG	Pass	Slight crowning and radial lines top only.	
28	C	37D	178.137	21/20	55	Closed	Pneumatic	7 PSIG	Pass	Slight crowning and very slight radial lines top and bottom.	
29	C	37D	178.137	21/20	55	Closed	Horizontal	4 FT	Pass	Top sagged. Reinforced chime separated slightly.	
30	C	37D	178.137	23	55	Closed	Horizontal	4 FT	Pass	Top sagged. Reinforced chime separated slightly.	

TABLE 4. TABLE OF RESULTS (Con't)

31	C	37D	178.137	23	55	Closed	Diagonal	4 FT.	Pass		
32	C	37D	178.137	23	55	Closed	Hydrostatic	15 PSIG	Pass	Radial lines at bottom.	
33	C	37D	178.137	23	55	Closed	Pneumatic	7 PSIG	Pass		
34	C	17E	178.116	18	55	Closed	Diagonal	4 FT	Pass	Leak at thlrd attitude.	
35	C	17E	178.116	18	55	Closed	Horizontal	4 FT	Pass		
36	C	17E	178.116	18	55	Closed	Hydrostatic	15 PSIG	Pass	Excessive crowning radial lines top and bottom.	
37	C	17E	178.116	18	55	Closed	Pneumatic	7 PSIG	Pass		
38	I	17H	178.118	18/16	55	Opened	Hydrostatic	15 PSIG	Fail	Massive leak at closure joint 11 lb.	5
39	I	17H	178.118	18/16	55	Opened	Horizontal	4 FT	Fail	Torque 800 in-lb. leak at end of crush pattern.	30
40	I	17H	178.118	18/16	55	Opened	Pneumatic	7 PSIG	Pass	Very slight crowning.	
41	E	17C	178.115	16	55	Closed	Hydrostatic	40 PSIG	Pass	Excessive radial lines crowning top and bottom.	
42	E	17C	178.115	16	55	Closed	Diagonal	4 FT	Pass	No leak initially - leak at second altitude at side.	

TABLE 4. TABLE OF RESULTS (Con't)

Exhibit	Company	DOT Specification	CFR Section Title 49	Gauge	Size	Type Closure	Test	Test Requirement	Result	Remarks	Figure
43	E	17C	178.115	16	55	Closed	Pneumatic	15 PSIG	Pass	Slight crowning top and bottom. Slight radial lines top and bottom.	
44	E	17C	178.115	16	55	Closed	Horizontal	4 FT	Pass	Slight puff at 2-inch bung. on impact.	
45	E	17E	178.116	20/18	55	Closed	Hydrostatic	15 PSIG	Pass	Moderate radial lines, crowning top and bottom.	
46	E	17E	178.116	20/18	55	Closed	Diagonal	4 FT	Pass	Leak at chime in impact area after two minutes and first roll.	
47	E	17E	178.116	20/18	55	Closed	Pneumatic	7 PSIG	Pass	Very slight radial stress bottom head.	
48	E	17E	178.116	20/18	55	Closed	Horizontal	4 FT	Pass	Drum humped on top.	
49	E	17E	178.116	18	55	Closed	Hydrostatic	15 PSIG	Drum Pass	Radial lines top and bottom. Leak at 2-inch bung due to gasket gathering. Retest for gasket. Pass.	
50	E	17E	178.116	18	55	Closed	Diagonal	4 FT.	Fail	Leak in impact area at chime.	17
51	E	17E	178.116	18	55	Closed	Pneumatic	7 PSIG	Pass		
52	E	17E	178.116	18	55	Closed	Horizontal	4 FT	Pass	Slight puff at both 3/4-inch and 2-inch bung.	

TABLE 4. TABLE OF RESULTS (Con't)

<u>Exhibit</u>	<u>Company</u>	<u>DOT Spec- ification</u>	<u>CFR Section Title 49</u>	<u>Gauge</u>	<u>Size</u>	<u>Type Closure</u>	<u>Test</u>	<u>Test Re- quirement</u>	<u>Re- sult</u>	<u>Remarks</u>	<u>Figure</u>
53	E	17H	178.118	18/16	55	Opened	Hydro- static	15 PSIG	Fail	Crowning top and bottom head. Leak at locking ring joint area. Radial stress lines. Leak stopped after 2 minutes.	6
54	E	17H	178.118	18/16	55	Opened	Diagonal	4 FT	Fail	Leak at initial contact area - leak at 90 degrees from contact after 2 minutes.	18
55	E	17H	178.118	18/16	55	Opened	Pneumatic	7 PSIG	Pass		
56	E	17H	178.118	18/16	55	Opened	Horizontal	4 FT	Pass	Retorque 800 in.lb. Slight puff on impact.	
57	F	17H	178.118	18/16	55	Opened	Hydro- static	15 PSIG	Fail	Slight crowning bottom and top head. Leak at closure joint in 2.5 minutes.	
58	F	17H	178.118	18/16	55	Opened	Hydro- static	15 PSIG	Fail	Slight crowning bottom head. Very slight radial stress at top. Slow leak at locking ring joint.	
59	F	17H	178.118	18/16	55	Opened	Diagonal	4 FT	Pass	Very slight puff of H ₂ O at impact. No leak thereafter.	
60	F	17H	178.118	18/16	55	Opened	Pneumatic	7 PSIG	Pass		
61	F	17H	178.118	18/16	55	Opened	Horizontal	4 FT	Pass	Torque 800 in-lbs.	

TABLE 4. TABLE OF RESULTS (Con't)

Exhibit	Company	DOT Specification	CFR Section Title 49	Gauge	Size	Type Closure	Test	Test Requirement	Result	Remarks	Figure
62	F	17E	178.116	18	55	Closed	Hydrostatic	15 PSIG	Pass	Top head slight radial lines - bottom head slight crowning.	
63	F	17E	178.116	18	55	Closed	Hydrostatic	15 PSIG	Pass	Slight radial lines top and bottom.	
64	F	17E	178.116	18	55	Closed	Diagonal	4 FT	Pass		
65	F	17E	178.116	18	55	Closed	Pneumatic	7 PSIG	Pass		
66	F	17E	178.116	18	55	Closed	Horizontal	4 FT	Pass	Very slight puff of H ₂ O at impact. Drum humped at top side.	
*67	H	37A	178.131	22	55	Opened	Diagonal	4 FT	Fail	Leaked at end of crush pattern.	
68	H	37A	178.131	22	55	Opened	Diagonal	4 FT	Fail	Very severe leak. Drum emptied in seconds.	
*69	H	37A	178.131	22	55	Opened	Diagonal	4 FT	Fail	Leaked at ring closure before dropping. Bolt ring tried, 100 in-lb. torque. Failed	
*70	H	37B	178.132	26	55	9" Open	Diagonal	4 FT	Pass	Slight dusting in second attitude.	36
*71	H	37B	178.132	26	55	9" Open	Diagonal	4 FT	Fail	Bottom and top seam split.	
*72	H	37B	178.132	26	55	9" Open	Diagonal	4 FT			
73	I	17H	178.118	18/16	55	Opened	Horizontal	4 FT	Fail	Re-torqued to 200 in-lb. Torque on impact at closure joint.	

*Powder

TABLE 4. TABLE OF RESULTS (Con't)

Exhibit	Company	DOT Spec- ification	CFR Section Title 49	Gauge	Size	Type Closure	Test	Test Re- quirement	Re- sult	Remarks	Figure
74	I	17E	178.116	18	55	Closed	Hydro- static	15 PSIG	Pass	Crowning and radial lines top and bottom.	
75	I	17E	178.116	18	55	Closed	Diagonal	4 FT	Pass		
76	I	17E	178.116	18	55	Closed	Pneumatic	7 PSIG	Pass

13. ABSTRACT <p>An investigation was conducted to evaluate various types of new metal drums and pails being used for the packaging and shipping of hazardous materials, to determine if these containers will spill their contents when subjected to high internal pressure and to specified rough handling tests. Various quantities of 17H and 17C open head drums as well as samples of 37A and 37C drums and pails spilled liquid contents after rough handling. In addition, some 37A, 37B drums and 37A and 37C pails spilled their dry (powder) contents after rough handling.</p>
